

The ABC Problem

Two integers x and y are chosen between 2 and 100.

The ABC Problem

Two integers x and y are chosen between 2 and 100.
A is told the product xy ,

The ABC Problem

Two integers x and y are chosen between 2 and 100.

A is told the product xy ,

B is told the sum $x + y$,

The ABC Problem

Two integers x and y are chosen between 2 and 100.

A is told the product xy ,

B is told the sum $x + y$,

and C is told nothing.

The ABC Problem

Two integers x and y are chosen between 2 and 100.

A is told the product xy ,

B is told the sum $x + y$,

and C is told nothing.

When asked what x and y are, the following conversation took place:

The ABC Problem

What are x and y ?

Some clarifications

The numbers x and y are between 2 and 100.

Some clarifications

The numbers x and y are between 2 and 100.

That is $2 \leq x \leq 100$ and $2 \leq y \leq 100$.

Some clarifications

The numbers x and y are between 2 and 100.

That is $2 \leq x \leq 100$ and $2 \leq y \leq 100$.

We don't consider that you get a different solution by switching x and y .

Some clarifications

The numbers x and y are between 2 and 100.

That is $2 \leq x \leq 100$ and $2 \leq y \leq 100$.

We don't consider that you get a different solution by switching x and y .

This is like saying “I have two coins in my pocket.”

Some clarifications

The numbers x and y are between 2 and 100.

That is $2 \leq x \leq 100$ and $2 \leq y \leq 100$.

We don't consider that you get a different solution by switching x and y .

This is like saying “I have two coins in my pocket.”

“One is a dime, the other is a nickel.”

Some clarifications

The numbers x and y are between 2 and 100.

That is $2 \leq x \leq 100$ and $2 \leq y \leq 100$.

We don't consider that you get a different solution by switching x and y .

This is like saying "I have two coins in my pocket."

"One is a dime, the other is a nickel."

"It doesn't matter which is which."

Some clarifications

The numbers x and y are between 2 and 100.

That is $2 \leq x \leq 100$ and $2 \leq y \leq 100$.

We don't consider that you get a different solution by switching x and y .

This is like saying "I have two coins in my pocket."

"One is a dime, the other is a nickel."

"It doesn't matter which is which."

If it helps, you may assume that $x \leq y$.

Some clarifications

The numbers x and y are between 2 and 100.

That is $2 \leq x \leq 100$ and $2 \leq y \leq 100$.

We don't consider that you get a different solution by switching x and y .

This is like saying "I have two coins in my pocket."

"One is a dime, the other is a nickel."

"It doesn't matter which is which."

If it helps, you may assume that $x \leq y$.

$x = y$ is allowed.

Getting Started

The obvious thing about the ABC Problem is that you are told only a bare minimum amount of information.

Getting Started

The obvious thing about the ABC Problem is that you are told only a bare minimum amount of information. Consider the following questions:

Getting Started

The obvious thing about the ABC Problem is that you are told only a bare minimum amount of information.

Consider the following questions:

If A is given $xy = 35$, does he know x and y ?,

Getting Started

The obvious thing about the ABC Problem is that you are told only a bare minimum amount of information.

Consider the following questions:

If A is given $xy = 35$, does he know x and y ?,

If A is given $xy = 30$, does he know x and y ?,

Getting Started

The obvious thing about the ABC Problem is that you are told only a bare minimum amount of information.

Consider the following questions:

If A is given $xy = 35$, does he know x and y ?,

If A is given $xy = 30$, does he know x and y ?,

If B is given $x + y = 12$, does she know x and y ?,

If B is given $x + y = 12$, does she know for certain that A cannot know the values of x and y ?,

Getting Started

The obvious thing about the ABC Problem is that you are told only a bare minimum amount of information.

Consider the following questions:

If A is given $xy = 35$, does he know x and y ?,

If A is given $xy = 30$, does he know x and y ?,

If B is given $x + y = 12$, does she know x and y ?,

If B is given $x + y = 12$, does she know for certain that A cannot know the values of x and y ?,
